

IMPERIAL TOP SECRET

NOT TO BE RELEASED UNDER PENALTY OF SLOW TORTUROUS DEATH

N1F1He1-1000

Scout Report

As recorded by scribe 5EF-83260-44
of the records division of the Holy Inquisition in the Mortis Maximus sub-sector

IMPERIAL TOP SECRET

NOT TO BE RELEASED UNDER PENALTY OF SLOW TORTUROUS DEATH

BACKGROUND

The asteroid discovered by the Adeptus Astronimican, namely N1F1He1-1000, have, due to its scheduled destruction, been the target of a scouting operation courtesy the space marine chapter Scouti Vindici.

The ice cold haze that surrounds the asteroid, and forms its tail, disrupts any orbital footage attempts of the surface, hence a ground operation was initiated.

Led by Captain John Anderson, company commander of the Scouti Vindici 13th company, a small scouting party deployed to the surface of the asteroid. Their mission was to find any weakness in its structure or a passageway to its core, to best place the strategic warheads designated to destroy the asteroid.

FINDINGS

What the scouting party found, confirmed the Inquisitorial suspicions. The following findings were reported before all contact with the scouting party were lost:

The nature of the soil samples collected confirms the asteroid to be the remnants of Niflheim, the moon of Hel in the Hel Segundo System. Somehow the Orks have converted the moon into a space craft of obscene proportions, with a propulsion system that seemingly can be fuelled by whatever sources available. The ground scanners indicate that the structure of the moon is semi hollow; hence a drilling operation could provide a way to the core.

The surface is swarmed with Ork activity, and the scouting party quickly came under the attention of a local Big Mek and his mechanized warriors at a construction site where what seems to be a Stompa were under construction.

Picture taken by scouting party 52.15.M42 on surface of N1F1He1-1000.

The fact that the Orks were mid construction of a Stompa, and the history of the Niflheim crusades, indicates that N1F1He1-1000 is sporting a huge army with several dangerous constructs.

Ork doctrines indicate that N1F1He1-1000 is speeding towards Beluga 61 by the Orks as a means of making planetfall. This may result in a head on collision (which would mean the destruction of all life on Beluga 61) or an orbital manoeuvre combined with

bombarding the planet with Rokks (huge fortified pieces of planetary rock launched towards the surface). Either way, N1F1He1-1000 should no longer be considered an asteroid easy to get rid of.

CONCLUSION

The asteroid N1F1He1-1000 is no asteroid at all, but in fact the remnants of Niflheim, now seemingly an Ork piloted moon.

The threat level of this object has to be raised, and its destruction should be set to top priority to stop it from ever reaching the Beluga System.

The citizens of Beluga 61 are not to be informed of the findings in this report, but further missions should be initiated to get a foothold on N1F1He1-1000 so a drilling operation for its core can commence.
